Already, in the last two chapters, the law of hereditary transmission has been tacitly assumed. . . . That wheat produces wheat—that existing oxen have descended from ancestral oxen—that every unfolding organism eventually takes the form of the class, order, genus, and species from which it sprang; is a fact which, by force of repetition, has acquired in our minds almost the aspect of a necessity. It is in this, however, that *heredity* is principally displayed; the phenomena commonly referred to it being quite subordinate manifestations. *Herbert Spencer*.

But in countries where there is an established church an opinion is deemed heresy when it differs from that of the church, and the Roman Catholic Church regard all who are not within her pale as guilty of heresy. Originally the heriot consisted of military furniture, or of horses and arms which went to equip the vassal's successor. Generally all rights in, or connected with land, are *heritable*. Whatever moves itself, or can be moved, without injury to itself or the subject with which it is connected, and whatever is not united to land is moveable. But these general rules are subject to exceptions and modifications. Things, in themselves moveable, may become *heritable* by succession. Whatever has been by art annexed to land, or other *heritable* subject, so that it cannot be removed without injury or change of nature, is *heritable*, by accession. Whatever is by growth connected with the soil is *heritable* under certain exceptions. *Bell's Scots Law Dict.*

The former is the common herring, and is too well known to require description. Its annual migration is not, as has been supposed, from a colder to a milder climate, but is probably from a deeper part of the ocean to a shallower. Impelled by the increasing burden of milt or roe, the herring leaves the deep water where it has passed the winter and spring months, and seeks the coast where it may deposit its ova, and where they may be exposed to the influences of oxygen, heat, and sun-light, which are essential to their development. They are generally followed by multitudes of hakes, dog-fishes, &c., and gulls and other sea-birds hover over the shoals. They swim near the surface, and are therefore easily taken by net. So great is their fecundity that the enormous number taken appears to produce no diminution of their abundance, as many as 68,000 eggs having been counted in the roe of one female. The herring-fishery has been prosecuted in England since the beginning of the eighth century. Herrings are found from high northern latitudes to as low as the northern coasts of France. They are met with on the coast of America as low as Carolina, and they are found in the seas of Kamtschatka. *C. leachii* is smaller than the common herring, but is deeper in body in proportion to its length. Sometimes the herse was an elaborate structure, sustaining a great number of wax tapers of different forms, and having a complete architectural character given to it by tabernacle work and images moulded in wax, in addition to the rich and costly silks, velvets, fringes, and banners with which it was covered. Up to quite recent times it was believed . . . that all the various processes of multiplication observable in different kinds of organisms have one essential character in common; it was supposed that in every species the successive generations are alike. It has now been proved, however, that in plants, and in numerous animals, the successive generations are not alike; that from one generation there proceeds another whose members differ more or less in structure from their parents; that these produce others like themselves, or like their parents, or like neither, but that eventually the original form reappears. Instead of there being, as in the cases most familiar to us, a constant recurrence of the same form, there is a cyclical recurrence of the same form. There would have been perfect truth and perfect righteousness, yet not *holliness*; for this is a word which denotes neither any one of the virtues in particular, nor the assemblage of them all put together, but the recoil or the repulsion of these towards the opposite vices—a recoil that never would have been felt, if vice had been so far a nonentity as to be neither an object of real existence nor an object of thought. *Chalmers.*

1. A quadruped of the genus *Equus* (*E. caballus*), constituting with the ass, zebra, and quagga the family Equidae or Solidungula. (For systematic characteristics see EQUIDÆ.) Much doubt exists as to the native country of the horse, some referring it to Central Asia, some to North Africa, and some holding that it is indigenous in many regions. It is also matter of doubt whether it is now anywhere to be found in its native state, the wild horses of the steppes of Tartary and other regions of the Old World being possibly descendants of animals escaped from domestication, while those now living in South America are well known to have sprung from the cavalry introduced by the Spaniards. Fossil

horses have been found associated with the mammoth and other extinct quadrupeds in the drift and in the bone-caverns of both the Old and New Worlds, twenty species having been described from North America alone, although no horses existed in America when it was discovered by Columbus. The horse varies much in form, size, and character with the climate and nature of the district it inhabits. It is now found in greatest perfection in England. Two breeds—namely, the large, powerful, black breed of Flanders, and the Arabian—have contributed more than all others to develop the present English varieties from the original, comparatively light-limbed, wiry race found by Cæsar. The former laid the foundation of size, strength, and vigour for draught-horses and for those anciently used in war; while, when mailed armour was laid aside, and the horse began to be used for the chase, the latter conferred speed and endurance. The ladies' palfrey is largely derived from the Spanish genet, a small, beautiful, fleet variety of the Moorish barb. The hunter,

characterized by speed, strength, and endurance, represents the old English, Flanders, and Arabian breeds. The race-horse has less of Flemish and more of Arabian blood. Other leading varieties are the Suffolk Punch and Clydesdale, both chiefly of Flanders blood, and the best for draught and agriculture; and several varieties of ponies, as Galloway, New Forest, Shetland, &c. Carriage, riding, and other horses combine the above breeds in varying degrees, as speed, strength, size, &c., are required. Horses are said to have 'blood' or 'breeding' in proportion as they have a greater or less strain of Arab blood. The wild horse of Tartary is called a *targan*, that of North Africa a *koonwah*, and that of America a *mustang*, the last being descended from European parents imported.—2. The male animal, in distinction from the female.

Horse-power (hors'pon-ër), *n.* The power of a horse or its equivalent; the force with which a horse acts when drawing. The mode of ascertaining a horse's power is to find what weight he can raise and to what height in a given time, the horse being supposed to pull horizontally. From a variety of experiments of this sort it is found that a horse, at an average, can raise 160 lbs. weight at the velocity of 2½ miles per hour. The power of a horse exerted in this way is made the standard for estimating the power of a steam-engine. Thus we speak of an engine of 60 or 80 horse-power, each horse-power being estimated as equivalent to 33,000 lbs. raised one foot high per minute. Engineers differ widely in their estimate of the work a horse is able to execute. That given above is the estimate of Boulton and Watt based on the work of London dray-horses, but it is considered much too high, 17,400 foot-pounds per minute being generally considered nearer the truth. As it matters little, however, what standard be assumed, provided it be uniformly used, that of Watt has been generally adopted. The general rule for estimating the power of a steam-engine in terms of this unit is to multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet, and the number of strokes per minute, the result divided by 33,000 will give the horse-power, deducting one-tenth for friction. As a horse can exert its full force only for about six hours a day, one horse-power of machinery is equal to that of 4½ horses. — *Nominal or calculated horse-power* is a term still used, but of little real value, from its being calculated on steam at a pressure much below the real power exerted. Sometimes the *real, actual, or indicated horse-power* exceeds the *nominal* by as much as three to one.

genus of fresh-water polypes of a very low type of structure. There are various species, as *H. viridis*, *H. fusca*, *H. vulgaris*. The body is in the form of a cylindrical tube, composed of two fundamental layers, the ectoderm and endoderm, the former containing in one variety green granules identical with the chlorophyll of plants. The base is disc-shaped, and by it the animal can attach itself to any body, being capable of shifting its position. The mouth is surrounded by a circle of extremely contractile tentacles, by which the animal obtains its food, and which are richly endowed with the urticating organs or thread cells so common in the order. The mouth opens immediately into the stomach, and there are no internal organs of any kind, nor anal orifice. The Hydra may be divided into almost any number of fragments, and each portion becomes developed into a fresh independent polypite. Reproduction is effected by gemmation as well as by the production of ova and sperm-cells.

made of the well-known principle in hydrostatics, namely, that a pressure exerted on any part of the surface of a liquid is transmitted undiminished to every part of the liquid and in all directions. By this apparatus great power is obtained for compressing objects, or drawing or lifting great weights. The press is usually constructed as shown in the accompanying figure. By means of a small forcing pump (the handle of which is shown at A in first figure, the piston at A in second) water is injected into a strong cast-iron cylinder B, into which is fitted the piston or ram C. The pressure transmitted by the water, acting upon the solid piston C, slowly and powerfully urges upwards the table D, until the requisite pressure is produced upon the materials placed between the upper and lower tables of the press. The power of this machine increases in proportion to the difference

between the diameter of the piston of the forcing pump and that of the large piston C; thus, if the diameter of the former is 1 inch and that of the latter 1 foot, the area of the cross section of the latter will be 144 times that of the former, and a pressure of 1 ton

upon the former will exert a pressure of 144 tons upon the latter. Hydrogen (hi'drô-jen), *n.* [Gr. *hydôr*, water, and *gennâo*, to generate.] An important elementary substance, for a long time only known in a separate state in the gaseous or permanently elastic form, but now shown to be the vapour of a metal, and itself capable of solidification. Hydrogen was first correctly described by Cavendish in 1766, under the name of *inflammable air*, and it was by some called *phlogiston*, from the notion that it is the matter of heat. The name *hydrogen* was given to it by the French chemists in consequence of its being one of the elements of water. It also forms a component of all vegetable and animal products, and is, therefore, abundantly diffused throughout nature. It is usually produced by the action of dilute sulphuric acid upon zinc or iron, or by passing the vapour

of water over red-hot iron. Pure hydrogen is a colourless, tasteless, and odorless gas; it is a powerful refractor of light; the least dense of all the gases, and hence the most rapidly diffusible, and the lightest body in nature. In consequence of its extreme lightness it is the recognized standard of unity in referring to the atomic weight of bodies or their combining proportions in regard to weight, and it has been assumed also as the unit in speaking of the specific gravity of gases, although common air is the more generally received standard. It is neither acid nor alkaline; it cannot support respiration, although it proves fatal to life from deprivation of oxygen, rather than from any inherent noxious quality. When in contact with air it is inflammable in an eminent degree, and burns with a pale blue flame; but it does not support combustion. Two volumes of hydrogen with six of air form an explosive mixture, and when two volumes of hydrogen are mixed with one of oxygen and inflamed, the explosion is extremely violent. The flame of hydrogen is sometimes employed for exciting intense heat; but the most intense heat that can be produced is caused by the burning of hydrogen in oxygen gas, and this principle has been applied to increase the temperature of blast-furnaces in iron-works, by making the gases pass separately through heated tubes to the furnace. Water is the sole product of the combustion of hydrogen gas; and when two volumes of pure hydrogen gas are mixed with one volume of pure oxygen gas, and the mixture inflamed in a proper manner by the electric spark, the gases totally disappear, and the interior of the vessel is covered with drops of pure water, equal in weight to the two gases. Again, if pure water be exposed to the action of voltaic electricity it is resolved into two volumes of hydrogen and one of oxygen; so that water is proved both by synthesis and analysis to consist of two volumes of hydrogen combined with one of oxygen, or of two parts by weight of hydrogen with sixteen of oxygen, so that the number 18 becomes the atomic weight of oxygen, and 18 the weight of a molecule of water. Hydrogen is sparingly soluble in water, nor is there any other liquid which is capable of dissolving it in great quantity. It unites with all other elementary gaseous bodies, and forms with them compounds, not only of great curiosity, but of vast importance and utility; thus with oxygen it forms water; with nitrogen, ammonia; with chlorine, hydrochloric acid; with fluorine, hydrofluoric acid, &c. It forms compounds also with carbon, iodine, phosphorus, cyanogen, sulphur, &c.

The term is more especially applied to the disease in man, *rabies* being considered preferable as the name of the disease which constitutes madness in animals. The members are, in all cases except that of *Hydra*, fixed ramified hydrosomes, on which many hydranths and gonophores are developed. The tentacula are either scattered over the hydranths or arranged in one circle round the mouth, or in two circles, one close to the mouth and one near the aboral end. Very generally—for example, in all Sertularidæ and Tubularidæ—there is a hard chitinous, cuticular skeleton or comosarc, which usually gives rise to hydrothecæ, into which the hydranths can be retracted. The gonophores present every variety, from sacs to free-swimming medusoids. The inner margin of the bell in these medusoids is always produced into a velum, and otolithic sacs and eye-spots are very generally disposed at regular intervals around the circumference of the bell. The great majority of what are sometimes termed the naked-eyed medusæ (*Gymnophthalmata*) are simply the free-swimming gonophores of *Hydrophora*.

It

consists generally of two circular boards, connected with leather fastened closely

round their edges, as in an ordinary pair of bellows, and having an upright pipe communicating with the interior. With a certain quantity of water is poured into the bellows, and weights placed upon the upper board, the water will rise in the tube above the level of the water in the bellows to such a height that the pressure caused by the weight of the small quantity of water in the tube is a balance for the water in the bellows and the weights; and it will be seen that the higher the water in the tube the greater the weight that will be sustained.—*Hydrostatic paradox*, the principle that any quantity of water however small may be made to balance any weight however great.—*Hydrostatic press*. I.

I is the ninth letter, and the third vowel of the English alphabet, in which it represents not only several vowel sounds but also the consonantal sound of *y*. The two principal sounds represented by it in English are the short sound as in *pit*, *pin*, *fin*, and the long as in *pine*, *fine*, *wine*, the latter being really a diphthongal sound. It has also three other sounds, viz. that heard in *first*, *dirk* (ē, the neutral vowel); that heard in *imachine*, *intrigue* (which, however, can scarcely be considered a modern English sound); and the consonant sound heard in many words when it precedes a vowel, as in *million*, *opinion*, *truncheon*. The short sound of *i* (as in *pin*), or one closely allied to it, is one of the oldest vowel sounds belonging to the Indo-European languages, the three vowels *a*, *i*, and *u* being regarded as the three original vowels of the primitive Indo-European speech. In the Teutonic languages, however, *i* is found only in comparatively few roots corresponding to an original *i*, among which we may mention *wit*, *wiss* (to know) = Goth. *witjan*, *G. wissen*, *L. videre*, *Gr. idein*, *Skr. vid*; *E. bitter* = *L. fidi* (*findo*), *Skr. bhīd*, to split. More commonly it takes the place of an original *a*, as in *sit*, from a root *siit* (*L. sedere*); *E. is*, *Skr. asti*; *E. brim*, *Skr. bhram* (to whirl); *E. middle*, *Skr. madhya*, &c. The diphthongal sound of *i*, as an English sound, is comparatively modern, being developed from an older *ī* (sounded as *ee* in *seen*) by the prefixing of an *a* sound. The same change has taken place in German and Dutch, but in these languages the new sound is represented by *ei* and *ij* respectively. This letter enters into several digraphs, as in *fail*, *field*, *seize*, *feign*, *friend*; and with *o*, as in *oil*, *join*, *coin*, it forms a proper diphthong. No genuine English word ends with *i*; this sound when occurring at the end of a word being expressed by *y*; it is written however in foreign words introduced into English, as *alkali*. I and J were formerly regarded as one character, and in many English dictionaries words beginning with these letters were classed together till comparatively recent times.

Ice (is), *n.* [A. Sax. *is*, *iss*; comp. D. *ijs*, Dan. and Sw. *is*, Icel. *is*, G. *eis*, O.G. *is*; referred along with *iron*, G. *eisen*, to a lost verb *eisan*, to shine or glance.] 1. Water or other fluid congealed or in a solid state; a solid, transparent, brittle substance, formed by the congelation of a fluid by means of the abstraction of the heat necessary to preserve its fluidity. Water begins to freeze at 32° of Fahrenheit, and in freezing expands very rapidly and with great force. In consequence of this expansion the ice becomes lighter than water, and floats on its surface. Its specific gravity is nearly 0.92, so that the volume of ice is to that of water as 1 to 0.92, consequently water expands by about one-eleventh of its bulk in passing into ice. During the formation of ice the particles arrange themselves into ranks and lines which cross each other at angles of 60° and 120°, as may be seen by examining the surface of water while freezing in a saucer. Artificial ice may be produced by the alternate condensation and expansion of common air. When air is compressed its heat is squeezed out of it, and when it is again allowed to expand it absorbs heat from the surrounding medium, and hence causes that medium to fall considerably in temperature. Ice is also produced by exposing water to the ac-

tion of substances that produce quick evaporation, such as ether and sulphuric acid. The process will be greatly accelerated if made to take place under the exhausted receiver of an air-pump. On this principle ice is formed artificially in the hottest countries. The temperature of freezing is lowered 0.075° C. for every atmosphere of pressure, so that the freezing and boiling points are both variable. — 2. Concreted sugar. — 3. Iceberg (is'bérj), *n.* [D. *ijsberg* — *ijs*, ice, and *berg*, a mountain.] A hill or mountain of ice; specifically, a vast and lofty body of ice floating on the ocean. These lofty floating masses are generally detached from the seaward termination of glaciers on shore, though sometimes formed at a distance from any land. They are found in both the frigid zones, and are sometimes carried towards the equator as low as 40°. Masses of this sort abound in Baffin's Bay, where they are sometimes 2 miles long and one-half or one-third as broad. Scoresby counted 500 of these bergs drifting along in latitudes 60° and 70° north, which rose above the surface of the sea to the height of from 100 to 200 feet, some of them a mile in circumference. It is computed that the depth of icebergs below the surface of the water is about eight times greater than the height above the water. Icebergs have been the agents in transporting large masses of mud, shingle, and rocks from the polar towards the tem-

Iceberg.

perate regions. Some have been seen bearing cargoes of from 50,000 to 100,000 tons. As such masses float southward, the ice under water gradually melts away until the berg becomes top-heavy and capsizes, depositing its burden on the bottom of the sea. Several of the phenomena of the northern drift or boulder-clay are due to this agency. Ancient terraces or sea-margins, to be seen high up on our hill sides, are in part drift brought as cargo by icebergs, deposited where they stranded, and levelled and arranged by water. The gravel-knolls, which occur so frequently on our level lands, are also in some cases cargoes deposited where an iceberg stranded on a shoal or flat and melted, the hillocks rising to the surface with the gradual rise of the sea-bottom. Icebergs are agents in the denudation of the sea-bottom, doing their work sometimes at the depth of 1800 feet.

Idea (i-dē'a), *n.* [L. *idea*; Gr. *idea*, from *idein*, to see.] 1. Form, image, model of anything in the mind; that which is held or comprehended by the understanding or intellectual faculties: as a philosophical term, now generally used to designate subjective notions and representations, with or without objective validity. For further information as to the significations in which this word has been used see extracts below.

I have used the word *idea* to express whatever is meant by phantasm, notion, species, or whatever it is which the mind can be employed about in thinking. . . . Whatever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call an *idea*.

In popular language *idea* signifies the same thing as conception, apprehension, notion. To have an *idea* of anything is to conceive it. In philosophical use, it does not signify that act of the mind which we call thought or conception, but some object of thought. —*Reid*.

The great leading principle of the metaphysical department, and principle which is never lost sight of in any part of the book [Hume's *Treatise of Human Nature*], is, that the materials on which intellect works are the *impressions*, which represent immediate sensation, whether externally, as by the senses, or internally, as by the passions and *ideas*, which are the faint reflections of these impressions. Thus, to speak colloquially, when I see a picture, or when I am angry with some one, there is an *impression*; but when I think about this picture in its absence, or call to recollection my subsided anger, what exists in either case is an *idea*. . . . The term *idea*, in the philosophical nomenclature of Hume, is thus used in a sense quite distinct from its previous current acceptations, and as different from its vernacular use by Plato, in reference to the archetypes of all the empirical objects of thought, as from its employment by Locke, who used it to express 'whatsoever is the object of the understanding when a man thinks'. —*J. H. Burton*.

This word (*idea*) is often applied to any kind of thought, or notion, or belief, but its more proper use is restricted to such thoughts as are images of visible objects, whether actually seen and remembered, or compounded by the faculty of imagination. The words *notion* or *opinion* would often be well substituted for the word *idea*. —*As. Taylor*.

Plato agreed with the rest of the ancient philosophers in this—that all things consist of matter and form; and that the matter of which all things were made, existed from eternity, without form; but he likewise believed that there are eternal forms of all possible things which exist, without matter; and to these eternal and immaterial forms he gave the name of *ideas*. In the Platonic sense, then, *ideas* were the patterns according to which the Deity fashioned the phenomenal or ectypal world.

—*Sir W. Hamilton*.

2. Popularly, *idea* signifies notion, conception, thought, opinion, belief, and even purpose or intention; as, I had no *idea* it was so late; I have an *idea* that he will come to-morrow; he had an *idea* of going to London; he hadn't an *idea* in his head.—*Innate ideas*. See *INNATE*.—*Abstract and complex ideas*. See *ABSTRACT* and *COMPLEX*.

which maintains that we have no rational grounds for believing in the reality of anything but perceptive minds, perceived ideas, and the relations of those ideas. Bishop Berkeley is regarded as the founder of modern idealism. According to this philosopher, all that really exists is spirit, or the thinking principle,—ourselves, our fellow-men, and God. Matter does not exist independently of our sensations or ideas, but conceptions of a material world are produced by the operation of the Deity upon our understanding, and the material world exists only in the Divine intellect, who awakens in us certain sensuous conceptions in a definite order, which order is what we call the course of nature. Some of the doctrines of the modern German idealists may be seen in the following extracts from G. H. Lewes.

I see a tree. The common psychologists tell me that there are three things implied in this one fact of vision, viz.: a tree, an image of that tree, and a mind which apprehends that image. Fichte tells me that it is alone who exist. The tree and the image of it are one thing, and that is a modification of my mind. This is *subjective idealism*. Schelling tells me that both the tree and my ego (or self) are existences equally real or ideal; but they are nothing less than manifestations of the absolute, the infinite, or undivided. This is *objective idealism*. But Hegel tells me that all these explanations are false. The only thing really existing (in this one fact of vision) is the idea, the relation. The ego and the tree are but two terms of the relation, and owe their reality to it. This is *absolute idealism*. According to this there is neither mind nor matter, heaven nor earth, God nor man. . . .

Having battered down almost every objection, trivial or serious, that could be offered, *idealism* reiterates its fundamental principle—All our knowledge of objects is a knowledge of ideas; objects and ideas are the same. Ergo, nothing exists but what is perceived.

The power or faculty of the mind by which it conceives and forms ideas of things communicated to it by the organs of sense. *Imagination*, in its proper sense, according to Reid, signifies a lively conception of objects of sight. It is distinguished from conception as a part from a whole. 'The business of conception,' says Stewart, 'is to present us with an exact transcript of what we have felt or perceived. But we have also a power of modifying our conceptions, by combining the parts of different ones so as to form new wholes of our own creation. I shall employ the word *imagination* to express this power. I apprehend this to be the proper sense of the word, if imagination be the power which gives birth to the productions of the poet and the painter.' *Imagination* might be defined as the will working on the materials of memory; not satisfied with following the order prescribed by nature or suggested by accident, it selects the parts of different conceptions or objects of memory to form a whole more pleasing, more elevated, more

sublime, more terrible, or more awful than has ever been presented in the ordinary course of nature. The terms often employed in a narrow acceptance as synonymous with *fancy*, which properly is only a lower or slighter development of the imaginative faculty. In its widest signification, however, imagination is co-extensive with *invention*, furnishing the writer with whatever is most happy and appropriate in language, or vivid and forcible in thought.

The power of the mind to decompose its conceptions, and to recombine the elements of them at its pleasure, is called its faculty of *imagination*.

One of the most perfect indicators is shown in the accompanying figure. It consists of a small cylinder, within which there works a

Richard's Indicator.

piston, the upper end of the spindle of which is attached to and moves a parallel motion consisting of three links, which carries a marker at its central point. The pressure is recorded on a piece of paper attached to a small cylinder, on which is impressed a reciprocating circular motion corresponding to the motion of the steam piston. As the indicator piston rises by the force of the steam and is brought back by a graduated spring when the pressure is reduced, the pencil traces on the paper a figure (an *indicator diagram*) representing the pressure of the steam at each point of the stroke. (b) An instrument for co-ordinating the motions of the piston and valve, called the *valve-indicator*. (c) A dynamometer for measuring the power of any prime mover. (d) An apparatus or appliance in a telegraph for giving signals or on which messages are recorded, as the dial and index hand of the alphabetic telegraph; specifically, the name given to a recording instrument invented by Professor Morse, by which messages are printed as they are received. The current sent traverses the coils of an electro-magnet, with which an armature, furnished with a lever projecting forward, is connected. When the current is in action the armature is drawn down to the magnet, and on the cessation of the current it is again raised by a spring attached to the extremity of the lever. The lever thus works up and down upon an axis. A style supplied with ink is attached to the end of the lever, over which a strip of paper is drawn continuously from a roller by clock-work. When the armature is down the style rises and comes in contact with the paper, making a mark on it; when the current ceases the spring draws the end of the lever and the style down and away from the paper. Any number and length of dashes, or of mere dots, can thus be produced, and it is by these dashes and dots that letters are indicated. (See MORSE ALPHABET.) Indigo (in-di-gō), *n.* [Sp. and It. *indigo*, from L. *indicum*, indigo, from *Indicus*, Indian, from *India*.] A well-known and beautiful blue vegetable dye, extensively employed in dyeing and calico printing. The indigo of commerce is almost entirely obtained from leguminous plants of the genus *Indigofera*, that cultivated in India being the *I. tinctoria*, and that in America the *I. Aril*. The plant is bruised and fermented in vats of water, during which it deposits indigo in the form of a blue powder, which is collected and dried so as to form the cubic cakes in which it usually occurs in commerce. In this state it has an intensely blue colour and earthy fracture, the kind most esteemed being that which, when rubbed by a hard body, assumes a fine copper-red polish. Indigo is quite insoluble in water, but when exposed to the action of certain deoxidizing agents it becomes soluble in alkaline solutions, losing its blue colour, and forming a green solution, from which it is precipitated by the acids white, but it instantly becomes blue by exposure to air. The indigo of commerce, besides some earthy matter, consists of indigo-blue, indigo-red, indigo-brown, and glutinous matter.—*Indigo blue*, or, as it has been called, *indigotin*, may be prepared from commercial indigo by treating it with dilute acids, alkalis, and alcohol; it is generally prepared by acting with reducing agents upon indigo-white. Indigotin has the formula C₁₆H₇N₃O₂. It forms fine right rhombic prisms which have a blue colour and metallic lustre. It is soluble in strong sulphuric acid; the solution has an intense blue colour, and is employed occasionally in dyeing, under the name of Saxon or liquid blue.—*Indigo white*, indigo obtained by subjecting commercial indigo to the action of reducing agents, such as alkaline fluids containing sulphate of iron, or a mixture of grape-sugar, alcohol, and strong soda lye. Reduced indigo forms a yellow solution in alkaline fluids, but, on free exposure to the air, absorbs oxygen and is reconverted into indigo-blue. This is the best method of obtaining the latter in a pure state, whence indigo-white is called also *indigogen*.—*Egyptian indigo*, a leguminous plant, the *Tephrosia apollinea*, a native of Egypt. It is narcotic, and yields a fine blue dye. The leaves are occasionally mixed with Alexandrian senna, and the plant is commonly cultivated for its indigo in Nubia. See **INDIGO-PLANT**.

4. In *logic* and *philos.* (a) the method of reasoning from particulars to generals, or the inferring of one general proposition from several particular ones; a process of demonstration in which a general truth is gathered from an examination of particular cases, the examination being so conducted that each case is made to depend upon the preceding one. Induction, as defined by Archbishop Whately, is a process of reasoning which infers respecting a whole class, what has been ascertained respecting one or more individuals of that class. According to Sir William Hamilton the word has been employed to designate three very different operations: (1) the objective process of investigating particular facts as preparatory to induction, which, he observes, is manifestly not a process of reasoning of any kind. (2) A material illation of a universal from a singular, as warranted either by the general analogy of nature, or the special presumption afforded by the object matter of any real science. (3) A formal illation of a universal from the individual as legitimated solely by the laws of thought, and abstracted from the conditions of any particular matter. The second of these operations is the inductive method of Bacon, which proceeds from particulars to generals, and from generals to still higher generalities, by means of rejections and conclusions, so as to arrive at those axioms and general laws, from which we may infer, by way of synthesis, other particulars unknown to us, and perhaps placed beyond the reach of direct examination. When general principles have once been established by induction, they can be employed as first truths or axioms, and applied to particular instances. This method reverses the order of the inductive process, as it proceeds from generals to particulars, and is termed *deductive* reasoning; thus, having once established the general principle that all terrestrial bodies tend to the earth's centre by gravity, the tendency of any particular body to the centre is immediately inferred from the general principle. (b) The conclusion or inference drawn from premises or from propositions which are admitted to be true, either in fact or for the sake of argument.—5. In *physics*, the property by which one body, having electrical, galvanic, or magnetic polarity, causes or induces it in another body without direct contact; an impress of molecular force, or condition from one body to another without actual contact.—*Electro-magnetic induction*, the influence by which an electric or galvanic current produces magnetic polarity in certain bodies near or round which it passes.—*Magnetic induction*, the action by which iron and other substances become magnetic when in a magnetic field, that is, when in the neighbourhood of magnets or currents of electricity.

Induction-coil.

produce temporary currents; the other, the *secondary coil*, is wound round the first, but carefully insulated from it, and in it is generated a current by induction every time the current begins or stops in the primary coil. The currents produced by induction possess high power of overcoming resistance as well as great quantity; and hence very intense effects, chemical, physiological, and luminous, are obtainable from them.

pseudopodia, but are furnished with vibratile cilia. Most are free-swimming, but some

form colonies by budding, and are fixed to a solid object in their adult condition. The body consists of an outer transparent cuticle, a layer of firm sarcode called the cortical layer, and a central mass of semiliquid sarcode which acts as a stomach. A nucleus, which is supposed to be an ovary, having attached to its outside a spherical particle called the nucleolus, and supposed to be a spermatid gland, is imbedded in the cortical layer. Contractions of the body are effected by sarcode fibres. The cilia, with which most are furnished, are not only organs of locomotion, but form currents by which food is carried into the mouth. Reproduction takes place variously. They are divided into three orders, Ciliata, Suctorina, and Flagellata, in accordance with the character of their cilia or contractile filaments. stigation, impulse from *instinguo*, *instinctum*, to impel—*in*, on, and *stinguo*, to prick, same root as in *sting*, *stick*.] 1. In its widest sense, the power or energy by which all organized forms are preserved in the individual or continued in the species. In this sense it has been applied to plants as well as to animals, but it is more common to consider instinct as belonging to animals, in which case it is defined as a certain power by which, independently of all instruction or experience and without deliberation, animals are directed to do spontaneously whatever is necessary for the preservation of the individual or the continuation of the kind. Such, in the human species, is the *instinct* of sucking exerted immediately after birth, and that of insects in depositing their eggs in situations most favourable for hatching. Instinct makes animals provide for themselves and young, and utter those voices, betake themselves to that course of life, and use those means of self-defence, which are suitable to their circumstances and nature. The nest of the bird, the honey-comb of the bee, the web of the spider, the threads of the silkworm, the holes or houses of the beaver, are all executed by instinct, and are not more perfect now than they were long ages ago. In the beginning of life we do much by instinct and little by understanding; and even when arrived at maturity, there are innumerable occasions on which, because reason cannot guide us, we must be guided by instinct. The complex machinery of nerves and muscles necessary to swallowing our food, walking, &c., is set agoing by instinct. The motion of our eyelids, and those sudden motions which we make to avoid sudden danger, are also instinctive.

(An *instinct*) is a propensity prior to experience and independent of instruction. *Paley.*

By *instinct* I mean a natural blind impulse to certain actions without having any end in view, without deliberation, and very often without any conception of what we do. *Kant.*

When two minute pencils of light, radiating from two different luminous points, and making a small angle with each other, fall upon the same spot of a screen or a piece of paper, they are found to act upon each other, producing different effects, which depend upon certain differences between the lengths of the two pencils. In some cases the pencils illuminate the paper or screen more strongly than either would have done singly, and sometimes they destroy each other's effects and produce a black spot or fringe. The phenomena of the interference of rays have been explained in accordance with the undulatory theory of light, and furnish a strong argument in favour of that theory.

Invertebrata (in-vert'é-brá'ta), *n. pl.* One of the two great divisions of the animal kingdom—the other being the *Vertebrata*—including all animals destitute of vertebre or a backbone. It comprises five of the six sub-kingdoms into which animals have been divided in accordance with their primary plans of structure or morphological types; viz., the Protozoa, Coelenterata, Annuloida, Annulosa, and Mollusca. See extract.

The *Invertebrata*, comprising the Protozoa, Coelenterata, Annuloida, Annulosa, and Mollusca, are collectively distinguished by the following points amongst others: the body, if divided transversely, or cut in two, shows only a single tube containing all the vital organs. These organs, in the higher *Invertebrata*, consist of an alimentary or digestive cavity, a circulatory or 'humal' system, and a nervous or 'neural' system. The side of the body on which the 'humal' or blood-vascular system is placed is called the 'humal aspect'; whilst the side of the body on which the main masses of the nervous system are situated is called the 'neural aspect.' When there is any skeleton, this is external (forming an 'exo-skeleton'), and it is really nothing more than a hardening of the skin. The limbs, when present, are turned towards the neural aspect of the body. *H. A. Nicholson.*

Iodate (íō-dát'), *n.* [See *IODINE*.] Any compound of iodic acid with a base. The iodates form deflagrating mixtures with combustible matters, and on being heated to low redness oxygen gas is disengaged, and a metallic iodide remains. None of them have been found native. They are all of very sparing solubility, excepting the iodates of the alkalies. See *IODIC*.

Iodic (í-od'ík), *a.* Containing iodine; as, *iodic silver*.—*Iodic acid* (HIO₃), an acid formed by the action of oxidizing agents on iodine in presence of water or alkalies. Iodic acid is a white semi-transparent solid substance, which is odorless, but has an astringent sour taste. It is very soluble in water, and detonates when heated with charcoal, sugar, and sulphur. Deoxidizing agents reduce it partly to hydriodic acid, which then reacts upon the remaining iodic acid to form iodine and water. It combines with metallic oxides, forming salts, which are termed *iodates*, and these, like the chlorates, yield oxygen when heated, and an iodide remains.

Iodide (í-od'id'), *n.* A binary compound of iodine, with elements more electro-positive than itself; thus, *iodide of sodium*, &c.

Iodine (í-od'in or í-od'in), *n.* [Gr. *íōdēs*, resembling a violet—*íōn*, a violet, and *eidos*, resemblance.] Sym. I. At. wt. 127. In chem. a peculiar non-metallic elementary solid substance, constituting one of the group of halogens. It exists in the water of the ocean and mineral springs, in marine molluscos animals, and in sea-weeds, from the ashes of which it is chiefly procured. At the ordinary temperature of the atmosphere it is a solid crystalline body. Iodine unites readily with chlorine, potassium,

&c., with the emission of light and great heat. It is a non-conductor of electricity, and, like oxygen and chlorine, is a negative electric. Like chlorine, it destroys vegetable colours, but with less energy. Its colour is bluish black or grayish black, of a metallic lustre. It is often in scales, resembling those of micaceous iron ore, sometimes in brilliant rhomboidal plates, or in elongated octahedrons. The specific gravity of solid iodine is 4.947. At 225° it fuses, and enters into ebullition at 347°. Its vapour is of an exceedingly rich violet colour, a character to which it owes the name of *iodine*. This vapour is remarkably dense, its specific gravity being 8.782. Iodine has a very acrid taste, and its odour resembles that of chlorine. It is an irritant poison; but in small doses, and cautiously administered, it has occasionally been of great service in certain forms of glandular disease. It is very sparingly soluble in water, but dissolves copiously in alcohol and in ether, forming dark brown liquids. It possesses strong powers of combination, and forms, with the pure metals, and most of the simple non-metallic substances, compounds which are termed *iodides*. With hydrogen and oxygen it forms *iodic acid*; combined with hydrogen it forms *hydriodic acid*. Starch is a characteristic test of iodine, forming with it a compound of a deep blue colour. This test is so delicate that a solution of starch dropped into water containing less than a millionth part of iodine is tinged blue by it. The great consumption of iodine is in medicine; it is employed in its pure state, and in the form of iodide of potassium.

Iodism (í-od'izm), *n.* In *pathol.* a peculiar morbid state produced by the use of iodine.

Iolite (í-ol'it), *n.* [Gr. *íōn*, a violet, and *lithos*, stone.] A silicate of magnesium, aluminium, and iron, a mineral of a violet blue colour, with a shade of purple or black, called also *Dichroite*, because the tints along the two axes are unlike, and *Cordierite*. It occurs in six-sided rhombic prisms. Its varieties are the smoky-blue peltom and steinhellite.

Ion (í-on), *n.* One of the elements of an electrolyte, or compound body undergoing electrolysis. Those elements of an electrolyte which are evolved at the anode are termed *anions*, and those which are evolved at the cathode *cations*, and when these are spoken of together they are called *ions*. Thus water, when electrolysed, evolves two ions, oxygen and hydrogen, the former being an *anion*, the latter a *cation*.

Ionian (í-ón'ian), *a.* Relating to Ionia in Greece, or to the Ionians; Ionic.

Ionic (í-on'ík), *a.* [Gr. *íōnikos*.] Relating to Ionia, or to the Ionian Greeks.—*Ionic order*, one of the five orders of architecture. The distinguishing characteristic of this order is the volute of its capital. In the Grecian Ionic the volutes appear the same on the front and rear; being connected on the flanks by a baluster-like form; through the external angles of the capitals of the corner columns, however, a diagonal volute is introduced. The Romans gave their Ionic four diagonal volutes, and curved the sides of the abacus. The Greek volute continues the fillet of the spiral along the face of the abacus, whereas in the Roman its origin is behind the ovolo. In the modern Ionic capital the volutes are placed diagonally, and the abacus has its sides hollowed out. The shaft, including the base, which is half a diameter, and the capital to the bottom of the volute, generally a little more, is about nine diameters high, and may be fluted in twenty-four flutes, with fillets between them; these fillets are semi-circular. The pedestal is a little taller and more ornamented than the Doric. The bases used with this order are very various. The Attic base is very often used, and with an astragal added above the upper torus makes a beautiful and appropriate base. The cornices of this order may be divided into three divisions—the plain Grecian cor-

nice, the dentil cornice, and the modillion cornice. The best examples of the Ionic order are the temple on the Ilissus, those of Minerva Polias and Erechtheus in the Acropolis, and the aqueduct of Hadrian at Athens; the temple of Fortuna Virilis and the Coliseum at Rome. The boldness of the capital, with the beauty of the shaft, makes it eligible for porticoes, frontispieces, entrances to houses, &c.—

long and two short.—*Ionic metre*, a metre consisting of Ionic feet.—*Ionic mode*, in music, an airy kind of music. Reckoning from grave to acute, it was the second of the five middle modes.—*Ionic sect or school*, a sect or school of philosophers founded by Thales of Miletus in Ionia. Their distinguishing tenet was, that water is the principle of all natural things.

The so-called white ipecacuanha consists of the roots of *I. ipecacuanha*.

Iota (í-ó'ta), *n.* [Gr. *íōta*.] Primarily the name of the Greek letter *i*, which in contractions is often indicated by a sort of dot under another letter (as *Ϸ*); hence, a very small quantity; a tittle; a jot.

You will have the goodness then to put no stuffing of any description in my coat; you will not pinch me an iota tighter across the waist than is natural to that part of my body. *Lord Lytton*.

Ipecacuanha (í-pé-kak'ú-an'á), *n.* [The Brazilian name.] An emetic substance, of a nauseous odour and repulsive bitterish taste, the dried root of several plants of the nat. order Rubiaceae growing in South America. All the kinds have nearly the same ingredients, but differ in the amount of the active

principle which they contain. The best is the annulated, yielded by the *Cephaelis Ipecacuanha*, a small shrubby plant, a native of Brazil, New Granada, and other parts of South America. Of this sort there are three varieties, namely, the brown, red, and gray or gray-white, called also greater, annulated ipecacuanha. As this is the only sort sent from Rio Janeiro, it is sometimes called Brazilian or Lisbon ipecacuanha. The root is hard, breaks short and granular (not fibrous), exhibiting a resinous, waxy, or farinaceous interior, white or grayish. Ipecacuanha is also obtained from the plants

Psychotria emetica, a native of New Granada, and *Richardsonia scabra*, a Brazilian plant. The dust or powder of ipecacuanha, applied to any mucous surface, causes irritation and increased secretion from the part. It is chiefly employed to excite the stomach either to augmented secretion, or to invert its action and produce vomiting. It is also capable, by being combined with other substances, of being directed to the skin, and producing increased perspiration; as in the well-known Dover's powder. When given in very small doses it improves the appetite and digestive powers; in a somewhat larger dose it acts on the intestines, and in a still larger, from 15 to 20 grains, it occasions vomiting. The roots of other plants are used in tropical countries as emetics, and are often termed ipecacuanha. The name of *American ipecacuanha* is given to the *Euphorbia ipecacuanha*, a plant which grows in sandy places in North America. It is emetic, purgative, diaphoretic; but apt to produce hypercatharsis.

Ipoeras, *n.* Hippocreas. *Chaucer.*

The iris and crocus are representatives of the predominant northern form of the order, as *Gladiolus* and *Ixia* are of the genera prevalent in the southern hemisphere. Iridium (i-rid'i-um), *n.* [*Ir* (which see), and Gr. *eidos*, resemblance.] A metal of a whitish colour, not malleable, found in the ore of platinum and in a native alloy with osmium. Its specific gravity is above 18. Sym. Ir. At wt. 197. It takes its name from the variety of colours which it exhibits while dissolving in hydrochloric acid. The native alloy with osmium, or native iridium, is of a steel-gray colour and shining metallic lustre. It usually occurs in small irregular flat grains, in alluvial soil, in South America. Iridium is of all metals the most infusible; it is brittle, and when carefully polished has the appearance of platinum. When heated to redness in the air, it finely divided, it is oxidized, but not in mass. One of its most remarkable characters is the extreme difficulty with which it is acted on by acids. When strongly heated it appears to be insoluble in all acids, but when reduced by hydrogen it is dissolved by nitromuriatic acid. Iridium combines with oxygen forming oxides, and with chlorine forming chlorides.

Iridosmine, **Iridosmium** (i-rid-os'min, i-rid-os'mi-um), *n.* In *mineral.* a native compound of iridium and osmium, forming an osmide of iridium, in which the iridium is less or more replaced by platinum, rhodium, and ruthenium. 3. It is perforated by a circular opening called the *pupil*, which is constantly varying its dimensions, owing to the varying contractions of the concentric and radiating muscular fibres of the iris. — 4. The flower-de-lis or flag-flower, a beautiful and extensive genus of plants of the nat. order

Iridaceæ. The species are chiefly distributed over Southern Europe and Northern Asia, a few being found in North America and North Africa. Other species, as *I. tuberosa*, *I. versicolor*, and *I. verna*, are cathartic. The seeds of the common British yellow flag (*I. pseud-acorus*), when roasted, form a substitute for coffee. A large number of species are in cultivation, and are justly valued for the beauty of their flowers. 5. It consists of a plate of highly polished black glass, having its surface smeared with a solution of fine soap and subsequently dried by rubbing it clean with a piece of chamois leather. If we breathe upon the glass surface thus prepared through a glass tube, the vapour is deposited in brilliant coloured rings, the outermost of which is black, while the innermost has various colours, or no colour at all, in proportion to the quantity of vapour deposited. The colours in these rings, when seen by common light, correspond with Newton's reflected rings, or those which have black centres, the only difference being that in the plate of vapour, which is thickest in the middle, the rings in the iriscopes have black circumferences.

Iron (Férn), *n.* [A. Sax. *iren*, *isen*, *isern*; comp. Goth. *eisarn*, Icel. *járn* (contr. from older *isarn*), O. H. G. *isarn*, Mod. G. *eisen*. The word appears to be in form an adj., and the name may have been given from glancing like ice. (See ICE.) Comp. Skr. *ayas*, W. *haearn*, Ir. *iaran*, Armor. *houarn*.] 1. The commonest and most useful of all the metals; of a livid whitish colour inclined to gray, internally composed, to appearance of small facets, and susceptible of a fine polish. Syn. Fe. At. wt. 56. It constitutes, according to some, about 2 per cent. of the whole mineral crust of the globe. Its occurrence in a native state, however, is exceedingly rare; but there are few mineral substances in which its presence may not be detected. Such as contain it in certain forms and in sufficient quantity are called *ores of iron*. Iron exists in nature under four different states—the native state; that of an oxide; in combination with combustible bodies, particularly sulphur; and finally, in the state of salts. The principal ores of iron are—(1) Hematite or ferric oxide. (2) Magnetite or ferrous-ferric oxide. (3) Clayband and blackband, which contain carbonate of iron. (4) Spathe or ferrous carbonate. (5) Iron pyrites or ferric sulphide. The *cast-iron* of commerce is obtained by the ore being calcined, or roasted, and thereby detached from its more volatile impurities, and then exposed, along with certain proportions of coal or coke and lime, to intense heat in a blast furnace. By the action of these materials at a high temperature the oxygen and earthy matter of the ore are separated from the metal, which by reason of its greater density collects at the bottom of the furnace and is run off into moulds, while the earthy matters float on the surface, and are run off as slag. This process is called *smelting*, and the iron in this state receives the name of *pig-iron*. It is converted into *wrought* or *malleable iron* by a further process of purification called *puddling*. It then becomes known in commerce as *rod* or *bar iron*. Cast-iron contains about 3.5 per cent. of carbon, malleable-iron about 0.4 per cent.; intermediate between the two in this respect stands *steel*, which contains about 1 per cent. of carbon, and possesses certain properties that render it perhaps the most important form in which this metal is employed, the range of its application extending from the minute and delicate balance-spring of a watch to the large and ponderous war vessel.

2. An instrument or utensil made of iron; as, a flat-iron; a smoothing-iron. Canst thou fill his skin with barbed iron? Job xlii. 7. 3. Usually in the plural, fetters; chains; manacles; handcuffs. He was laid in iron. Ps. cv. 18. —To have many irons in the fire, to be engaged in many undertakings.

'Iron-witted fools.' *Shak.* (d) Capable of great endurance; firm; robust; as, an iron constitution. (e) Not to be bent; inflexible; as, an iron will. —Iron age (*a*), in *class. myth.* the last and wickedest and most unlovely

It was the age in which the ancient writers themselves lived, and is presumably that in which we now are. (b) In *archæol.* the last of the three ages into which archaeologists have divided the prehistoric period of the post-tertiary epoch. In the iron age implements, &c., of iron begin to appear, although stone and bronze implements are found along with them. The iron age had commenced in our country before the Romans brought it into the region of history. See AGE, Bronze Age under BRONZE.

Iron-bark Tree (Férn-bärk trê), *n.* A name among Australian colonists for the species of the genus *Eucalyptus* which have solid bark, but more particularly to the species *E. resinifera*, an Australian tree with ovate-lanceolate leaves which attains a height of from 150 to 200 feet. From this tree is obtained Botany Bay kino, used in medicine as a substitute for kino. When the bark of the tree is wounded a red juice flows very freely, and hardens in the air into masses of irregular form, inodorous and transparent. Sixty gallons of juice may sometimes be obtained from a single tree. The timber is also very valuable.

The illustration shows a section of part of the armour of the *Thunderer*, this portion, as will be seen, projecting beyond the vessel's side proper. The projecting armour consists of iron plating varying from 8 to 12 inches in thickness, backed by some 18 inches of teak. To increase the efficiency of these vessels for warfare they are often constructed as rams, and provided also with revolving turrets containing guns of immense calibre. They are also divided into a number of water-tight compartments, communicating with each other by water-tight doors. See RAM, TURRET-SHIP.

Mr. Marsh, however, remarks that 'the fact that Robert of Gloucester, and other early English writers, wrote *île* or *yle* at a time when the only French orthography was *isle*, is a strong argument against this derivation. It is more probably a contraction of *island*, the *A.Sax. ealand*, *ealand*, *igland*, and the *s* was inserted in both because when Saxon was forgotten the words were thought to have come through the French from the Latin *insula*.'] 1. Such are the *Isthmus* of Panama or Darien, connecting the two great continents of North and South America; the *Isthmus* of Suez, separating the Mediterranean from the Red Sea.—2. In anat. that passage which divides the cavity of the mouth from that of the throat. It is formed above by the pendulous veil of the palate and uvula, at the sides by the pillars of the fauces, and below by the base of the tongue.—*Isthmus* of the thyroid gland, a transverse cord connecting the two lobes which compose the thyroid body.

It (it), *pron.* [A. Sax. nom. *hit*, genit. or pos. *his*, dat. and instrumental *him*, acc. *hit*; O. E. *hit*, *hyt*, *it*, pos. *his*; O. Sax. *it*; Goth. *ita*, D. *het*, O. H. G. *iz*, G. *es*; L. *id.*] 1. A pronoun of the neuter gender, generally classed as a demonstrative, and corresponding with the masculine pronoun *he*, and the feminine *she*, having the same plural *they*. 'Keep thy heart with all diligence; for out of it are the issues of life.' *Prov. ix. 23*. Here *it* is the substitute for heart.—2. *It* is much used as the nominative to verbs called impersonal; as, *it* rains; *it* snows. In this case there is no determinate thing to which *it* can be referred.—3. Very often *it* is used to introduce a sentence, preceding a verb as a nominative, but referring to a clause or distinct member of the sentence following. This has been called the prospective use of *it*. 'It is well ascertained that the figure of the earth is an oblate spheroid.' What is well ascertained? The fact that the figure of the earth is an oblate spheroid; *it* (that) is well ascertained. Here *it* represents the clause, 'the figure of the earth, &c.' If the order of the sentence is inverted the use of *it* is superseded, thus: That the figure of the earth is an oblate spheroid is well ascertained. Similarly *it* is often used for a preceding clause of a sentence; as, we have been defeated for the present, *it* is true, but we are not yet conquered.—4. *It* often begins a sentence when a personal pronoun, or the name of a person, or a masculine or feminine noun follows, and it may represent any one of the three persons or of the

three genders; as, *It* is I, be not afraid; *it* was Judas who betrayed Christ; *it* is thou; *it* was they who did so.

'Tis these that gave the great Apollo spoils. *Pope*.

When a question is asked *it* follows the verb; as, who was *it* that betrayed Christ?

5. *It* is used also for the state of a person, state of matters, condition of affairs, or the like; as, has *it* come to this?

How is *it* with our general? *Shak.*

6. *It* is used after intransitive verbs very indefinitely, and sometimes imports a ludicrous shade of meaning, especially after a noun used as a verb for the occasion. In this use *it* is rarely employed in an elevated style.

If Abraham brought all with him, it is not probable that he meant to walk *it* back for his pleasure. *Raleigh*.

The Lacedemonians, at the straits of Thermopylae, when their arms failed them, fought *it* out with their nails and teeth. *Dryden*.

Whether the charmer sinner *it*, or saint *it*. *Pope*.

The possessive case *its* does not appear till a year or two before 1600, *his* being used both for the masculine and the neuter possessive.

This apoplexy is, as I take it, a kind of lethargy . . . I have read the cause of *his* effects in Galen. *Shak.*

When the transition from the possessive *his* to *its* was taking place the old dialectal and uninflected possessive *it* was frequently used, as it is still in Scotland. Several instances of this occur in Shakspeare, and at least one in the Bible of 1611, *Lev. xxv. 5*, 'That which growth of *it* own accord,' now changed to *its*.

Do, child, go to *it* grandam. *Shak.*

It knighthood shall do worse. It shall fright *all* friends with borrowing letters. *B. Jonson*.

In such phrases as '*It* is me,' '*It* is him,' *it* is exceedingly indefinite. Here *me* and *him* may be regarded as a sort of nominatives, like the French *moi* in the phrase '*C'est moi*.' Professor Bain says it may be confidently affirmed that, with good speakers, in the case of negation, '*It* is not me' is the usual practice. '*It* is I' is, however, suited to occasions of dignity; as, 'Jesus spake unto them, saying, Be of good cheer; *it* is I; be not afraid.' In old English the substantive verb often agrees with the nominative following; thus we find, instead of '*It* is I,' '*It* am I.'

The solid portion is of an intermediate substance between bone and horn, and contains about 24 per cent. of gelatine; it is readily distinguished from bone by its peculiar rhomboidal net-work, shown when the ivory is cut transversely. Helix* (the common ivy) is found throughout almost the whole of Europe, and in many parts of Asia and Africa. It is plentiful in Britain, growing in hedges, woods, on old buildings, rocks, and trunks of trees. J. The tenth letter in the English alphabet, and the seventh consonant. The sound of this letter coincides exactly with that of *gingenius*. It is therefore classed as a palatal, and is the voiced sound corresponding to the breathed sound *ch* (as in *church*). (See G.) The sound does not occur in Anglo-Saxon, and was introduced through the French. The French, now, however, has a different sound. As a character it was formerly used interchangeably with *i*, both letters having originally the same sound; and after the *j* sound came to be common in English it was often written where this sound must have been pronounced. The separation of these two letters in English dictionaries, indeed, is of comparatively recent date, being brought about through the influence of the Dutch printers.—In medical prescriptions, at the end of a series of numerals, *j* is generally put for *i*; as, *vj* (six); *viii* (eight).—J.
